Cardiff University

Overview

➤ Hierarchical modelling 程序代写代做 CS编程辅导

- Scene graphs
- Constructing graphs

➤ Spatial data structures

- Uniform grids
- Octrees
- kD-trees
- BSP-trees

Hierarchical Modelling

- A **scene** is the complete description of the environment
 - A **view** is a particular part of the scene visible from the camera position
 - A scene consists of many models, only some are visible
- A scene can be represented by a **hierarchical structure**
 - A node represents some part of the scene
 - Top node is the whole scene
 - Leaf nodes are the actual geometric models
- Objects specified in *local coordinates*
 - Add transformation to hierarchy to specify location in scene

Scene Tree Example

➤ Scene tree for a simple car

Scene Graph Example

➤ Scene graph: combine congruent objects

Scene Graphs

- Scene Graphs are **程序代写代做C/C++编程辅导** *directed graphs*
 - Explicitly represented by graph data structure
 - Or implicitly by **二维码** sequence of instructions / function calls
- **Attributes and inheritance**
 - Graph may contain material, transformation, . . . nodes representing object attributes
 - Attributes are usually inherited by all sub-nodes
- Also suitable for animations:
 - Make transformations dependent on parameter, e.g. time, motion control parameters, . . .

Robot Arm—OpenGL Implementation

```
T.initialize();
T.scale(0.5f, 0.5f, 0.5f);
T.scale(2f,0.4f,1f);
T.translate(1,0,0);
T.rotateA(-50f, -0.2f, 0f, 1f);
gl.glUniformMatrix4fv( ModelView,
                        T.getTransform(), 1, true,
                        gl.glUniformMatrix4fv( NormalTransform, 1, true,
                        T.getInverseTransform(), 0 );
gl.glDrawElements(GL_TRIANGLES, numElements,
                  GL_UNSIGNED_INT, 0);
```

```
T.initialize();
T.scale(0.5f, 0.5f, 0.5f);
T.scale(1.5f,0.4f,1);
T.translate(0.75f,0,0);
T.rotateZ(50);
T.translate(2.00f, 0.0f, 0);
T.rotateA(-50f, -0.2f, 0f, 1f);
gl.glUniformMatrix4fv( ModelView, 1, true,
                        T.getTransform(), 0 );
gl.glUniformMatrix4fv( NormalTransform, 1, true,
                        T.getInverseTransform(), 0 );
gl.glDrawElements(GL_TRIANGLES, numElements,
                  GL_UNSIGNED_INT, 0);
```

Hierarchy Construction

- Problem: find **optimal hierarchy** for scene graph
 - Choose bounding volumes
spheres, boxes,  hulls, ...
 - Construct hierarchy of objects based on some heuristic
(depends on application)
- Consider solutions for special cases
 - Spatial closeness of models
 - Standard spatial data structures

Spatial Data Structures

➤ Represent *spatial* 程序代码代做CS编程辅导 in scene graph

- Which models are visible from a camera position?
- Which models are processed from a certain position?
- With which model does a model collide?
- ...

➤ The more information about the spatial relations between models is known, the faster the scene can be processed

- *Partition* space and place objects within subregions
- Create *hierarchy* of spatially close models
- Helps algorithms to determine relevant models quickly

Uniform Grids

- Partition space *uniformly* using a 3D grid
- 3D array of model lists

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

- Cut models along partition planes
- Or add them to all relevant areas

Octrees

- Partition space using a 3D *hierarchical grid*
 - Tree with 8 children per node

Octrees for Scene Graph Hierarchy

➤ Octree construction (Quadtree in 2D)

- Generate octree for models until no cell contains more than one model
- Group models/□ the same cell at the same level

kD-Trees

- Input: n points in k dimensions
- Output: tree that *partitions space at axis-aligned planes*
 - Each point is contained in its own box-shaped region

kD-Trees

- Generalisation of ~~程序竞赛代码~~ ~~use~~ ~~编程辅导~~
 - At each node find a point which *separates* remaining points into two (approximately) equal sized sets
- In k dimensions, repeat for level:
 - *Choose* one dimension
 - *Sort* points in 1D
 - *Split* points at median
- Choice of dimension:
 - Regular, e.g. x, y, z, x, y, . . .
 - Dimension where distance between points is maximal
 - Some other clever strategy

kD-Tree Generalisation

➤ kD-Trees can be generalised to handle models

- Median cut in x , then y . . .
- Search for best fit from a small set of plane orientations

➤ kD-Tree gives hierarchy for scene graph

BSP-Trees

- Use a *binary space partitioning* (BSP) tree to order models
- Identify planes to *partition objects* into those in front of and those behind planes hierarchically
 - For polygons we propose one of them to define a *partitioning plane*
 - Polygons intersecting the plane are cut in two
 - Recursively continue splitting the polygon sets
- Particularly useful when view point changes, but objects remain at same position (partitioning does not change)
- kD-tree is a special case of BSP-tree

Multi-resolution Scene Graph

程序代写代做 CS编程辅导

<https://tutorcs.com>

Multi-resolution Scene Graph

Scene Graph Issues

- *Minimise transformations* 程序代做 CS编程辅导
 - Each transformation is expensive during rendering, etc.
 - Need automatic optimisations to reduce transformation nodes
- *Minimise attribute changes* (materials, etc.)
 - Each state change is expensive during rendering
- Many more scene graph optimisation problems. . .

Summary

- What is a scene graph / tree? 程序代写代做 CS编程辅导
- Explain the principles of the following spatial data structures:
 - Uniform grid
 - Octree
 - kD-tree
 - BSP-tree
- Given a set of objects, how are these data structures constructed?
- How can these data structures be used to improve scene graph performance?
