Viewing Transformations

➤ Viewing transformations:

- *Camera transformation*: 3D world coordinates to 3D camera coordinates
- *Projection transformation*: Define a viewing volume, and transform 3D camera coordinates onto the view plane
- *Viewport transformation*: The image on the view plane is translated and scaled to be fitted in the viewport on the screen

Projection

- General definition
 - Transform points in nD space to mD space, $n > m$
- In computer graphics
 - Map 3D camera frustum to 2D view plane coordinates
 - Also map depth to normalized device coordinates (NDC) range $[0, 1]$, related to viewing volume)

Parallel Projection

- Centre of projection is at *infinity*
- Direction of projection (DOP) is the *same* for all points

Parallel Projection Matrix

- General parallel projection transformation (defined by α, ϕ)
- Orthogonal (orthographic) projection for $\alpha = 90^\circ$

程序代写代做 CS编程辅导

$$\begin{pmatrix} x_p \\ y_p \\ z_p \\ w_p \end{pmatrix} = \begin{pmatrix} 1 & 0 & -L_1 & 0 \\ 0 & 1 & -L_2 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x_c \\ y_c \\ z_c \\ w_c \end{pmatrix}$$

<https://tutorcs.com>

Orthographic Projection

- Direction of projection *orthogonal* to view plane
- Points with the same (x, y) coordinates will project at the same point on view plane

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

- Applications: for exact scaling the object like CAD etc

Oblique Projection

- Direction of projection *not orthogonal* to view plane
- For **cavalier projection** ($\alpha = 45^\circ$), two points with the same (x, y) coordinates will have their **distance** on the view plane
 - For **cabinet projection** ($\alpha = 63.4^\circ$), two points with the same (x, y) coordinates will have half their **distance** on the view plane
- Applications: for technical drawing and illustration like in furniture, or architecture, etc.

Cavalier
(DOP at 45°)

Cabinet
(DOP at 63.4°)

Perspective Projection

- Map points onto view plane along projectors emanating from centre of projection

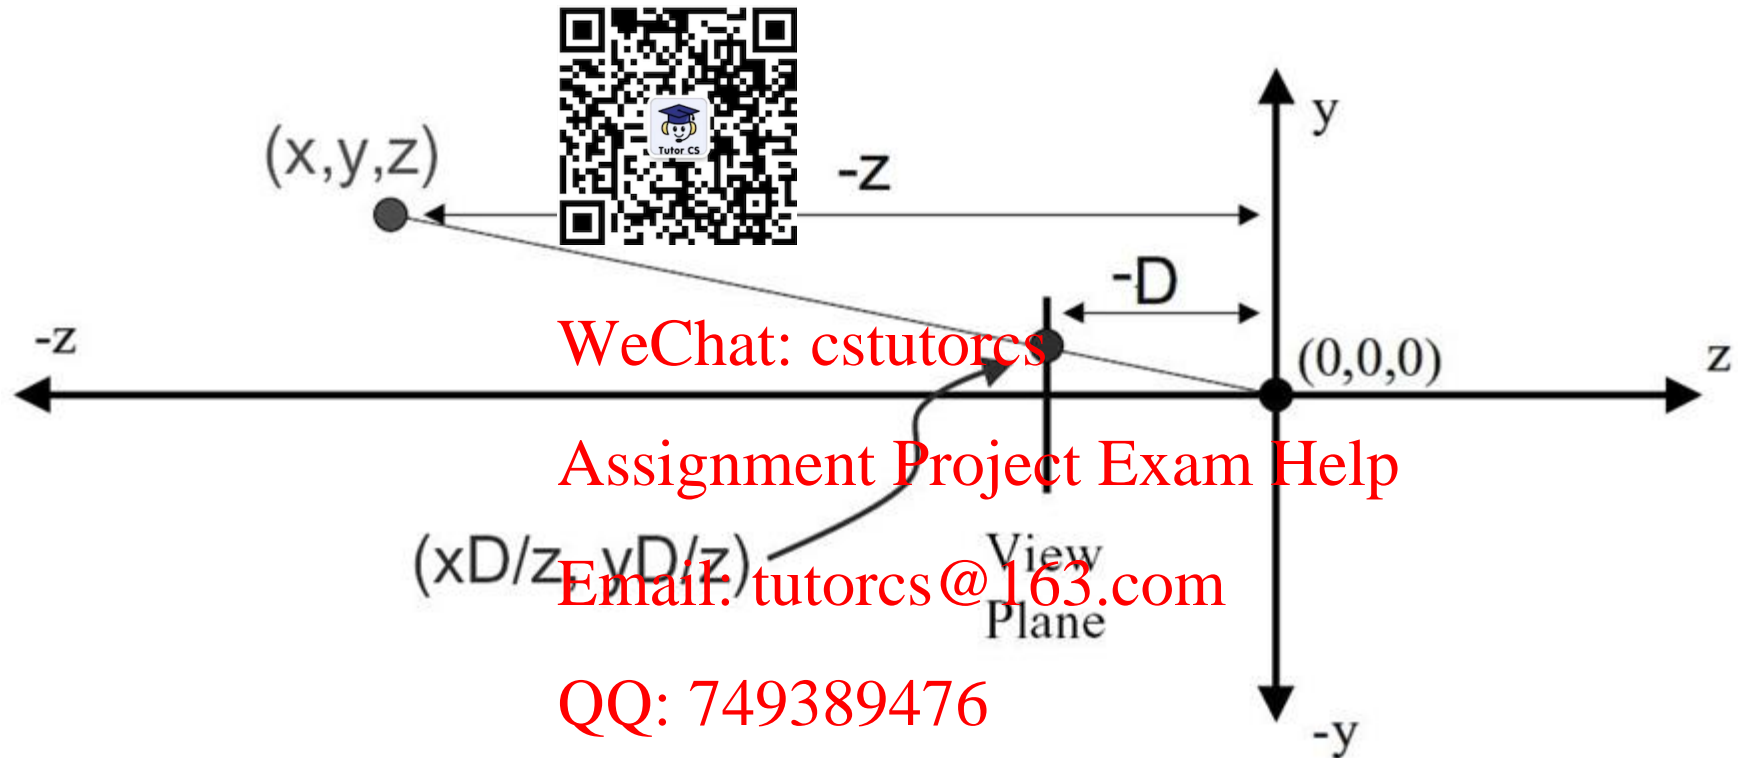

- Application : for art drawings, especially for representing large scenes.

Perspective Projection

- Compute 2D coordinates from 3D coordinates using *similar triangles*

$$\frac{y_c}{z_c} = \frac{y_p}{D} \quad \frac{x_c}{z_c} = \frac{x_p}{D} \quad \text{for } D < 0$$

Perspective Projection Matrix

- 4×4 homogeneous coordinates matrix representation

$$\begin{aligned}x_p &= x_c D / z_c & x'_p &= x_c \\y_p &= y_c D / z_c & y'_p &= y_c \\z_p &= D & z'_p &= z_c \\w_p &= 1 & w'_p &= z_c / D\end{aligned}$$

Perspective vs. Parallel Projection

- Perspective projection
 - Size varies inversely with distance – looks realistic
 - Distance and angles are not (in general) preserved
 - Parallel lines do not (in general) remain parallel
- Parallel projection
 - Good for exact measurements
 - Parallel lines remain parallel
 - Angles are not (in general) preserved
 - Less realistic looking

Viewport on Screen

➤ Coordinate systems on display:

- **Screen coordinate system**: Origin at the upper-left corner of the screen. x direction from left to right, and y direction from top to bottom.
- **Window coordinate system**: Origin at the lower-left corner of the window. x direction from left to right, and y direction from bottom to top.
- **Viewport**: The rectangular region in the window where the image is drawn. Defined on window coordinate system by (x_0, y_0, w, h) .

Viewport Transformation

- The whole image on the view plane are mapped on the whole viewport (by scaling and translating)
- To avoid distortion, the aspect ratio of the viewport should be equal to the aspect ratio of the viewing volume
 - **aspect ratio**: The ratio of the width to the height of a rectangle area (w/h)

OpenGL Projection

- Actual projection is set by projection matrix
- Projection matrix specifies parallel or perspective projection param
- Projection matrix is initially defined by selecting a **viewing volume** (the region camera can see)
- Points inside the viewing volume are projected into a cube of edge length 2 (x, y, and z all **range from -1 to 1**)
 - **Depths** are maps of the z coordinate to the range [0, 1]
- **Orthographic** and **perspective** projections are implemented in class Transform, simulating the projection functions in OpenGL fixed-function pipeline

Orthographic Viewing in Transform

ortho (xmin, xmax, ymin, ymax, near, far);

程序代写代做 CS编程辅导

➤ Projection matrix:

$$P = \begin{pmatrix} \frac{2}{x_{\max} - x_{\min}} & 0 & \frac{x_{\max} + x_{\min}}{far - near} & 0 \\ 0 & \frac{2}{y_{\max} - y_{\min}} & \frac{y_{\max} + y_{\min}}{far - near} & 0 \\ 0 & 0 & \frac{far + near}{far - near} & 1 \\ 0 & 0 & 0 & 0 \end{pmatrix}$$

WeChat: cstutorcs

➤ No oblique projection is implemented

Perspective Viewing in Transform

`frustum (xmin, xmax, ymin, ymax, near, far);`

➤ Projection matrix:

$$P = \begin{pmatrix} \frac{2near}{x_{\max} - x_{\min}} & 0 & \frac{2near}{y_{\max} - y_{\min}} & 0 \\ 0 & \frac{2near}{y_{\max} - y_{\min}} & \frac{far + near}{far - near} & \frac{2far \cdot near}{far - near} \\ 0 & 0 & -1 & 0 \end{pmatrix}$$

<https://tutorcs.com>

Using Field of View

- frustum not intuitive
- Better interface (for symmetric frustum):

perspective (fovy, near, far) =
frustum (-w2, w2, -h2, h2, near, far);

$$h_2 = \text{near} \cdot \tan(\text{fovy} / 2)$$

$$w_2 = \text{aspect} \cdot h_2$$

OpenGL Viewport

`glViewport (x, y, width, height);`

程序代写代做 CS编程辅导

- Default value (0, 0, winWidth, winHeight)
 - winWidth and winHeight specify the size of the window
- Map points drawn in the view plane into the viewport
 - Coordinate transforming from $([-1,-1] \sim [1,1])$ on the camera coordinate system to $([x,y] \sim [x+width, y+height])$ on the window coordinate system
- When combined with `perspective()`, either
 - `glViewport (x, y, width, height);`
`perspective(fovy, width/height, near, far);`
 - `glViewport (x, y, width, width/aspect);`
`perspective(fovy, aspect, near, far);`
- Similar when combined with `ortho()`
